

LOGAN THOMAS

(510) 205-8343 | loganrichthomas@gmail.com | linkedin.com/in/loganthomas29 | loganrthomas.github.io | Alameda, CA

EDUCATION

UNIVERSITY OF CALIFORNIA, LOS ANGELES (UCLA) | Bachelor of Science, Mechanical Engineering | GPA: 4.0 Expected Jun 2029
Incoming Fall 2026: Project Lead, Bruin Space CubeSat · Undergraduate Researcher, Mechanics of Soft Materials Lab

SKILLS

Design & Modeling: SolidWorks (CSWA), AutoCAD, Design for Manufacturability, GD&T / Tolerancing, Kinematics, Rapid Prototyping
Simulation & Analysis: FEA (SolidWorks Simulation), Statics, MATLAB, Simulink / Simscape (Model Calibration), Python (Data Analysis)
Data & Machine Learning: scikit-learn (Random Forests), Model Validation (Cross-Validation, ROC-AUC), MATLAB Image Analysis
Manufacturing: Manual Machining, Waterjet, Laser Cutting, Sheet Metal Forming, Silicone Molding, FDM 3D Printing, Mechanical Assembly
Electronics & Testing: Embedded Systems (Arduino), IMU Integration (MPU-6050), Design of Experiments (DOE), Root Cause Analysis (RCA), Instrumented Thermal Testing, Technical Documentation

EXPERIENCE

ENGINEER INTERN | DOER Marine | *Manned Research Submersible* Jun 2026 – Sep 2026

- Deployment Rig Design:** Took a moonpool transducer deployment rig from rough concept to a manufacturable SolidWorks assembly, specifying lead screw, bearing, and guide-shaft hardware and resolving mating constraints.
- Structural Analysis & Load Path:** Raised a bending-stress question on the rig's load-bearing frame through hand calculation, then compared three beam configurations in FEA, cutting peak stress from 6.57 to 1.70 ksi with a stock C-channel section.
- Thermal Test Rig & Instrumentation:** Designed and built an instrumented test fixture benchmarking two battery-wall cooling designs across 8 controlled trials, iterating a camera enclosure to eliminate thermal-reflection measurement artifacts.
- Simulation & Drawings:** Calibrated a Simscape/MATLAB heat-transfer model against trial data, and produced the full machinist drawing package for a battery enclosure, toleranced for machinability while preserving fit.

ENGINEERING RESEARCH INTERN | ¹BL (UCLA Bioelectronics Lab) | *Ferrobatic Viral Testing Platform* Jan 2026 – Jun 2026

- Injection Port Integration:** Developed a mass-producible molding process embedding custom 2-mm self-sealing RTV silicone ports into testing cartridges, using root-cause analysis of mold geometry and fill sequencing to prevent recurring air-entrapment defects.
- Precision Enclosure:** Engineered a modular enclosure with a precision-guided sliding cartridge, achieving sub-millimeter vertical tolerances to preserve optical line-of-sight and unrestricted ferrobot kinematics.
- Mechanism Design:** Designed and 3D-printed a cross-spherical gear mechanism driven by two monopole gears for two-axis tilt control, running actuation trade-offs across competing designs to define the roadmap for closed-loop stabilization.

Independent Research Project — Microfluidic Dispenser Characterization & ML Modeling

- End-to-End ML Pipeline:** Built an end-to-end characterization pipeline spanning experimental design, chip fabrication, 369-trial data collection, and MATLAB image analysis to map dispenser geometry to droplet output.
- Predictive Modeling & Validation:** Trained a Python random-forest model predicting droplet volume to 0.369 μL cross-validated error, diagnosing overfitting via the CV/train ratio and building an inverse-design tool for geometry selection.

TECHNICAL PROJECTS

SELF-DEPLOYING LAPTOP STAND | Personal Project | *Mechanism Design* Jun 2026 – Sep 2026

- First-Principles Statics:** Derived the statics of a spring-deployed parallelogram linkage symbolically, proving by contradiction that no equilibrium exists at any deployed angle and reframing the hard stop, not the linkage or spring, as the true load path.
- FEA-Driven Iteration:** Cut max resultant displacement from 2 mm to 0.1 mm under the same load case, moving the load path from a linkage-integral hard stop to a compression flap and lightweighting the platform 46% via a rib iteration.
- Destructive Load Test:** Loaded the assembled stand to failure at 215 N, roughly 10 $\times$ the design load, and diagnosed it as a friction joint sliding along its own axis rather than a material failure, with no fracture or yield anywhere.
- Materials Testing:** Designed and ran a 12-sample bend test on printed PETG, quantifying $\pm 1.6\%$ measurement uncertainty before claiming significance and finding infill pattern drives stiffness $\sim 3\times$ more than density.
